

The aim of the conference is to advance and unify international (research) data management and to foster exchange. We will discuss open issues and future challenges on topics such as terminologies, metadata, ontologies, repositories and many more. Likewise, opportunities for networking and exchange with the research community will be provided.

Whether researchers, teachers or industry representatives - all those interested in (research) data management are welcome. Through presentations of research results, informative workshops and tutorials, as well as case studies, we would like to discuss how data management can be implemented in engineering theory and practice.

**FAIR-IMPACT is presenting an abstract for a session focused on how FAIR-IMPACT is expanding FAIR Solutions across the European Open Science Cloud.**
